

Re: ADU Proposed Landscaping at 31 King Street

#### Landscape Proposal for 31 King Street Accessory Dwelling Unit

As stated in the approved Wastewater Treatment System Plan and Details, there will be an underground infiltration system, consisting of two plastic chambers, installed at the Northwest side of the proposed ADU. This will contain any water runoff from the proposed ADU.

All disturbed areas will be loamed and seeded as required.

There will be the installation of four or five 6'-8' Weeping Cherry Trees along the north side of the property. This area is along the roadway and will be in addition to any trees or shrubbery already on site. The addition of these trees will limit the openness in front of the proposed ADU and will blend with the landscape of the area. These trees typically grow 8'-16' tall and 6'-12' wide. They have green leaves with the exception of when they full bloom with large pink flowers.
